

Bachelor's thesis - user tasks

1. Task 1

You enjoy reading blogs about how to properly care for flowers, whether cut or potted. Find the latest blog post in our prototype and click on it. Mark the task as complete on the subpage containing this blog post.

1.1 Usability problems

When filtering the latest blog posts, there are several filters on the posts subpage. The filter in the upper-right corner filters posts by topic, while the icons in the left corner sort posts from newest to oldest, as shown in Figure. We assume that respondents will naturally go to the filter on the right, and when they realize that it does not sort posts by date, they will start looking for another way to complete the task. At this point, they should notice the filters in the upper-left corner and complete the task.

2. Task 2

You recently purchased Aloe Vera on our website and would like to write a review. Go to the Aloe Vera product page and add a review describing your experience. Mark the task as complete after submitting your review, i.e., on the page that says "Your review was added successfully."

2.1 Usability problems

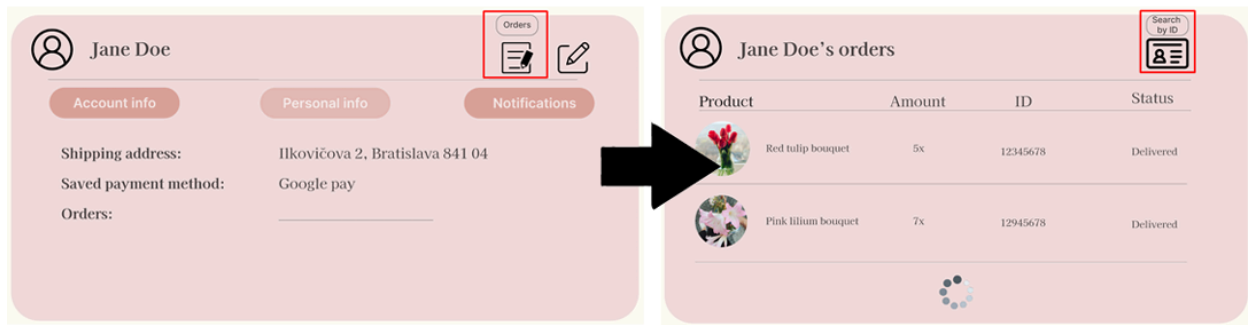

On the subpage where participants are supposed to add a review, there are two buttons for adding a review. The button located above the reviews, which is more intuitive, does not actually work. This button redirects to a page displaying an error message. The second—functional—button is located next to the product name. This button is less intuitive and also less visible. In reality, such a situation can easily arise due to an oversight when rolling out a new design.

3.Task 3

Last week, you placed an order for a bouquet of sunflowers and would like to check the status of your order. Find the order tracking feature and search by order ID (ID = 88889999) to check its status. Mark the task as complete on the subpage where this order is filtered.

3.1 Usability problems

The key is to find the order tracking feature. It is located in the user's profile after they log in. First, however, you need to navigate to the correct tab. The "Orders" label serves as an indicator that you are on the correct tab, though it is currently empty; to view the actual list of orders, you must click the button in the top-right corner. On the tab to which the user is redirected, an additional button with an icon appears in the top-right corner, which allows you to click through to filter orders by ID. The sequence of button clicks is shown in Figure.

4. Task 4

Plánujete kúpiť kyticu ku narodeninám svojej mamy. Váš rozpočet je 45€ a chcete minúť všetky peniaze. Nájdite, pridajte do košíka a kúpte kyticu kvetov, ktorá spĺňa nasledujúce požiadavky:

`\begin{enumerate}[label=$\bullet$]`

`\item` má bielu farbu,

`\item` pozostáva z troch kusov.

`\end{enumerate}`

Platbu realizujte pomocou platobnej karty VISA.

Úlohu označte ako ukončenú na podstránke po zaplatení, keď sa zobrazí okno s textom "Thank you for your purchase".

You are planning to buy a bouquet for your mother's birthday. Your budget is €45, and you want to spend all of it. Find, add to your cart, and purchase a bouquet of flowers that meets the following requirements:

- is white,
- consists of three pieces of flower.

Make the payment using a VISA credit card.

Mark the task as completed on the subpage after payment, when a window with the text "Thank you for your purchase" appears.

4.1 Usability problems

When completing this task, keep in mind that the user needs to find a flower that costs €15, since their budget is €45 and they want to buy a bouquet consisting of 3 flowers. Another challenging part is filtering the bouquets. There are three separate filters available, but they do not overlap—each applies independently. How the participant finds the right flower is up to them, but the flower they are looking for is the intersection of these three filters. After finding the correct flower, the participant must then select the correct number of flowers, as shown in Figure. For each of the quantities shown, the participant can only click through to the specified number; that is, from 0–5, 6–10, 11–15. The rest of the task is straightforward.
